Recently, a WWW-based CAI/CAL system has been needed as the Internet spreads rapidly. We also have been engaged in developing a WWW-based CAI/CAL system that supports to learn and teach foreign language. In this paper, we present a WWW-based training system that supports to learn German. This system, which enables the learner to learn the language at a level, has the following three features: First, this system is closely linked with WWW-based teaching materials (lexical and grammar materials) which we have devised, second, the teacher can edit exercises on WEB browser, third, the form of this exercises is often used in examinations of foreign languages at universities in Japan. This system has just been used by the students at our university, and we receive good evaluation from them. We intend to improve this system in order to make it easier-to-use to satisfy the needs and requests of the learner.
